THEATRE ADMIN DASHBOARD

Design a theatre admin dashboard. You need to keep the following points in mind while making it :

- The admin should log on to the main(index) page. In case any admin exists, he should be redirected to a login page. If not, the user should be directed to a sign up page.
- Passwords should be hashed and salted.
- Login page should also have a functionality to add new signups.
- Once the user successfully logs in, the home page will have a search functionality under which user can search movies already added by the admin.
- There should be an add movie functionality via which user can add new movie to the dashboard with all the required field(movie name, description, director, duration). Make sure there is no repetition.
- Another functionality will be add timings. The user can use this functionality to add timings,price,total tickets for existing added movies.
- Third functionality is purchase tickets. User can make a purchase an already add movie at a specific time depending upon the functionality.

Note
1. Make sure the validations are added. Focus on finishing the functionality first, you will be majorly assessed on that. We expect a basic UI at least .
2. There is only 1 single user who is the admin user
3. If you can add more functionality it will fetch you more points
4. Feel free to use any techstack to make this
5. You can add these functionalities in same page or different pages
